

Eliminating Side Effects with Pure Functions

Gerald Britton

IT SOLUTIONS DESIGNER

Overview

Simple – do one thing and do it well

Limited number of arguments

Output depends on input

Same input \Rightarrow same outputs

State not used or modified

No side effects

Complexity through combination

One Function or Three?

```
def get_ints(ints, odd=True, even=True):  
    if odd and even:  
        return [i for i in ints]  
    elif odd:  
        return [i for i in ints if i % 2]  
    elif even:  
        return [i for i in ints if not i % 2]  
    else:  
        return []
```

Do it all function

```
def get_even_ints(ints):  
    return [i for i in ints if not i % 2]  
  
def get_odd_ints(ints):  
    return [i for i in ints if i % 2]  
  
def get_all_ints(ints):  
    return list(ints)
```

Split them!

Recap

Added new functionality

Set the expedited flag

Eliminated None handling

Added two pure functions

Refactored using the pure functions

Cannot purify everything

Input and output are impure

Minimize and isolate impure operations

```
import dis  
  
def f(x):  
    return x.g(lambda x: x.good, lambda x: x.member)  
  
dis.dis(f)
```

Lambdas in Python

Import the dis module

Define a simple test function

Disassemble it

0	LOAD_FAST	0 (x)
2	LOAD_ATTR	0 (g)
4	LOAD_CONST	1
	(<code><code object <lambda></code>	...
6	LOAD_CONST	2
	(<code>'f.<locals>.<lambda>'</code>)	
8	MAKE_FUNCTION	0
0	LOAD_CONST	3
	(<code><code object <lambda></code>	...
2	LOAD_CONST	2
	(<code>'f.<locals>.<lambda>'</code>)	
4	MAKE_FUNCTION	0
6	CALL_FUNCTION	2
8	RETURN_VALUE	

◀ Disassembled function

◀ Load lambda 1

◀ Make it a function!

◀ Load lambda 2

◀ Make it a function

◀ Call the original function

◀ Return the results

```
def l1(x): return x.good
def l2(x): return x.member
def f(x): return x.g(l1, l2)
dis.dis(f)
```

Helper Functions

Define functions to replace the lambdas

Use the replacements in the main function

Disassemble it

0	LOAD_FAST	0	(x)
2	LOAD_ATTR	0	(g)
4	LOAD_GLOBAL	1	(l1)
6	LOAD_GLOBAL	2	(l2)
8	CALL_FUNCTION	2	
10	RETURN_VALUE		

◀ Disassembled function

◀ Load function 1

◀ Load function 2

◀ Run the original function

Lambdas vs helper functions

Use lambda functions or
helpers?

It depends!

Lambdas are used where
defined

~~Premature Optimization~~

Summary

Introduced pure functions

- Output depends on input
- No side effects

Added ability to set expedited flag

Created pure functions map and filter

Made other new functions pure

Discussed pros and cons of lambdas
